Design of the RF deflecting cavity

A normal conducting deflecting cavity has been developed for beam separation. The cavity kicks the alternating bunches from a single beam into two beamlines.

Electromagnetic design and multiphysics analysis of the cavity

Ilmit

Field measurement

- The deflecting mode field profile along the beam axis was obtained using the bead-pull technique
- Spherical beads (ϕ 5 mm) were used
- Dielectric sphere perturbs only electric field
- Metallic sphere perturbs both electric and magnetic field
- •Only electric field exists at the middle of the cavity (z=0). Thus, the

Falametei		value	Unit
Cavity: width x height x length		275x181x500	mm
Cavity aperture	V_{ap}	30	mm
Resonance frequency	f ₀	273	MHz
Transverse R/Q	R_{\perp}/Q	9.96	MΩ
Intrinsic Q-factor	Q_0	11188	-
Geometry factor	G	57.03	Ω
Deflecting voltage	V_{\perp}	300	kV
RF power loss	P_0	810	W
Peak electric field	E_{pk}	2.49	MV/m
Peak power loss density	S _{pk}	1.21	W/cm ²

Cavity fabrication

a) Top stem

Port A

Pick-up probe Port B

- dielectric sphere values are scaled to match the metallic sphere at z=0.
- Subtracting the values obtained from the metallic sphere with the scaled values corresponds to |H|²

Testing of the cavity

b) Middle part

Frequency tuner Main coupler **Port D and E** Port C

Pre-tuning of the resonance frequency

- Fabrication error shifts the resonance frequency
- Stems were machined to the exact dimension
- The middle part of the cavity was machined with an excess

RF test setup

At an RF power of 400 W, the temperature on the pick-up \overline{N}

increased to 67 °C.

Reason: Stainless steel pick-up no active cooling **Solution:** Silver coating

The cavity was vacuum conditioned at 1 kW and a maximum temperature of 43 °C was measured on the pick-up.

The cavity is ready for testing in the beamline
